WELLNESS+

Mobile App UX/UI Case Study & High-Fidelity Mockups

Project type Mobile wellness & fitness app	**Role** UI/UX Designer
Deliverables Research • User Flow • Wireframes • UI	**Tools** Figma • Notion • User testing

Case study summary

Wellness+ is a simple mobile experience that combines daily movement, balanced meal guidance, mindfulness and progress tracking in one low-friction flow. The design focuses on consistency rather than complexity: users can understand their next action within seconds and see progress without feeling overwhelmed.

Submission note

This document is a complete case-study/report deliverable created from the assignment brief. A live Figma URL must be added by the student if the course requires an actual editable Figma file.

01 — Purpose, Problem & Goals

Problem statement

People who want to improve their daily wellness often use separate apps for workouts, meals and mindfulness. Switching between tools makes it harder to maintain a routine. Wellness+ brings the essential actions into one focused dashboard.

Design goals

Goal	Design response
Reduce friction	Show one clear next action and keep primary navigation simple.
Support consistency	Use daily goals, progress and reminders instead of complicated plans.
Personalize	Let users set goals, activity level and preferred routines.
Build trust	Use predictable patterns, readable typography and transparent actions.

Primary user

Persona: Anjali, 26 — A beginner-to-intermediate wellness user who wants a realistic routine that fits around work and home responsibilities. She values simple guidance, visual progress and reminders, but dislikes information overload.

02 — Competitor Research & Opportunity

The research compares common patterns found in wellness products. The goal is not to copy individual products, but to identify opportunities for a clearer, more unified experience.

Product category	Common strength	Observed limitation	Wellness+ opportunity
Fitness trackers	Strong progress metrics	Can feel data-heavy	Keep only actionable daily metrics
Workout apps	Large exercise libraries	Choice overload for beginners	Recommend a small daily plan
Meal planners	Structured meal content	Separate from activity goals	Connect meals to daily routine
Meditation apps	Calm guided sessions	Narrow focus	Make mindfulness one part of the whole day

Key insight

> *A beginner does not necessarily need more features; they need better prioritization. The design therefore treats the Home screen as a daily decision surface: what should I do next, how am I progressing, and where do I go for the rest of my plan?*

03 — User Flow

The primary flow is designed around a short path from first launch to completing a daily activity and checking progress.

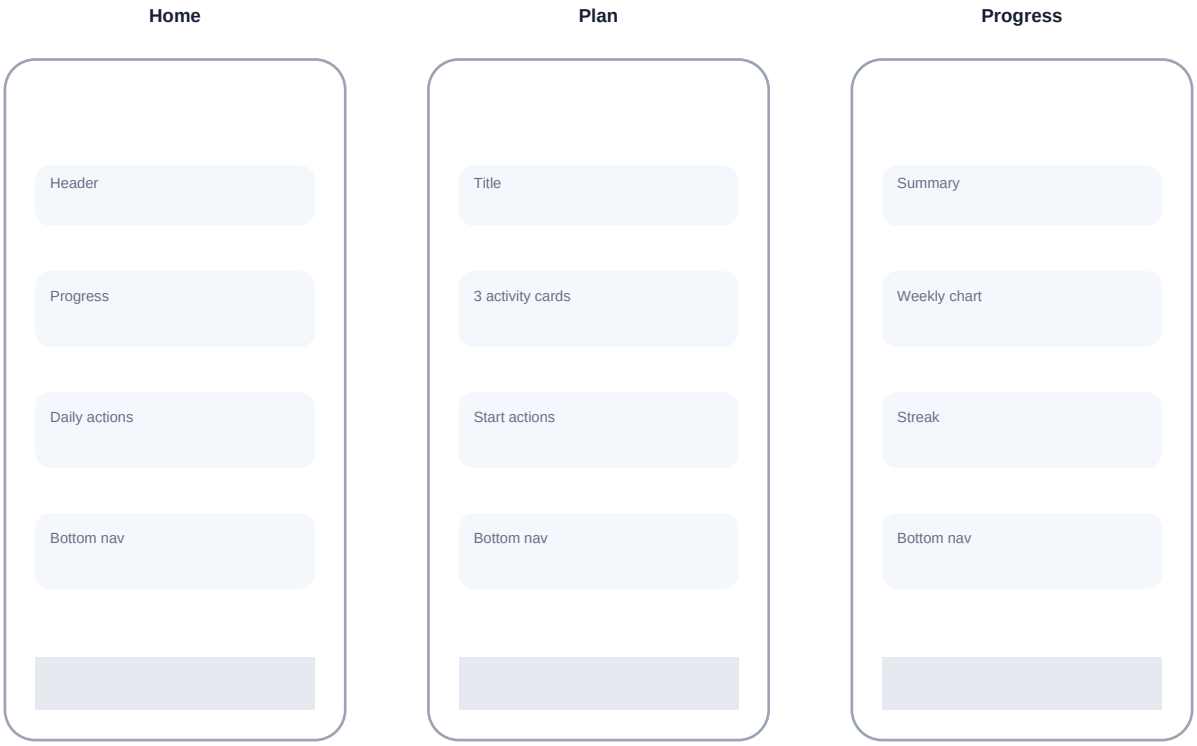
1	**Onboarding**	Set basic goal + preferences
↓	**Home**	See today's progress and next actions
↓	**Plan**	Open workout / meal / mindfulness activity
↓	**Activity**	Complete or skip the selected action
↓	**Progress**	Review daily completion and streak
↓	**Profile**	Adjust goals, reminders and preferences

Navigation model

A four-item bottom navigation is used: Home, Plan, Progress and Profile. This keeps the most important destinations visible and reduces hidden navigation. Secondary actions remain inside the relevant screen.

04 — Low-Fidelity Wireframes

The wireframes test hierarchy and flow before visual styling. The main question at this stage is whether users can find the next action quickly.



Wireframe decision: the content hierarchy is intentionally card-based, with one primary action per section. This reduces cognitive load and gives the final UI a predictable structure.

05 — Visual Design System

The visual system was defined before polishing individual screens to keep the high-fidelity mockups consistent.

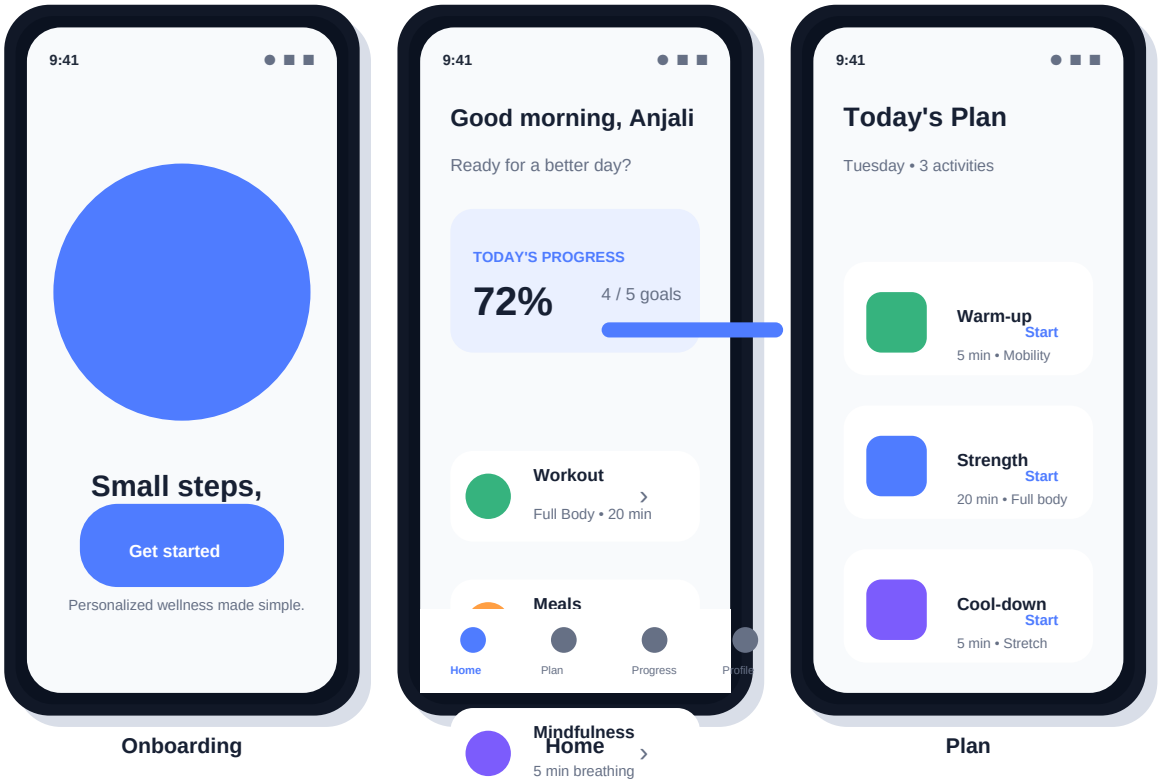
Element	Specification	Purpose
Primary color	#4F7CFF	Primary actions, active navigation, focus states
Success color	#36B37E	Completed activity / positive progress
Accent colors	#FF9F43 / #7C5CFC	Secondary categories and visual grouping
Background	#F8FAFC	Soft neutral canvas for reduced visual fatigue
Heading type	Bold, 18–27 pt	Strong hierarchy and scanability
Body type	Regular, 9–12 pt	Readable supporting content
Cards	12–16 px radius	Clear grouping without heavy borders
Spacing	8 px base rhythm	Consistent alignment and component spacing

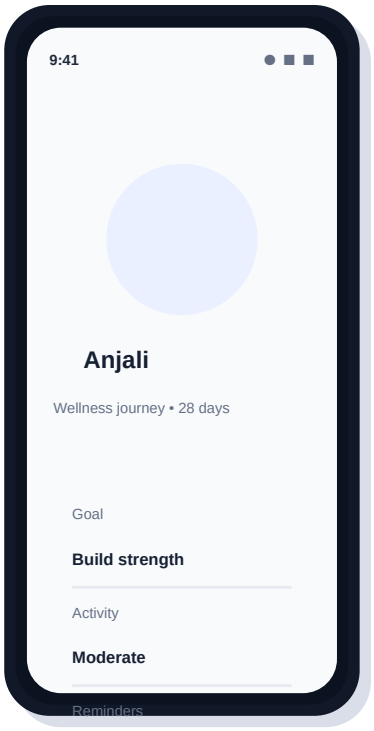
UI principles

1. One primary action per card. 2. Consistent icon and text alignment. 3. High contrast for important text. 4. Touch targets designed to be comfortably tappable. 5. Status is communicated through text and structure, not color alone.

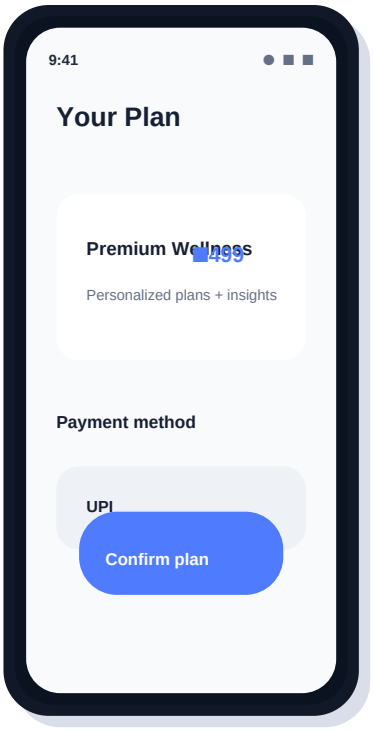
06 — High-Fidelity Mockups

The following screens represent the major app surfaces required by the brief: onboarding, home, navigation, plan/service content, profile and checkout.





Profile



Checkout / Plan

07 — Key Design Decisions

Decision	Why it was chosen
Four-item bottom navigation	Keeps high-frequency destinations visible and predictable.
Progress card on Home	Answers the user's first question: “How am I doing today?”
Small daily plan	Avoids overwhelming beginners with an oversized content library.
Color-coded categories	Creates fast recognition between workout, meal and mindfulness content.
Short onboarding	Collects only information needed to personalize the first experience.
Clear confirmation action	Checkout/plan screens separate summary from the final action to reduce accidental taps.

Navigation rationale

The navigation pattern intentionally avoids a hamburger menu for primary destinations. A visible bottom bar makes Home, Plan, Progress and Profile immediately discoverable, supporting both new and returning users.

08 — Usability, Accessibility & Feedback Iterations

Usability checks were framed around realistic beginner tasks rather than visual preference alone.

Task	Expected result	Iteration
Find today's workout	User reaches Plan in one tap from Home	Made the Plan card more prominent
Check progress	User finds daily completion without searching	Added progress summary to Home
Change goal	User finds preference controls in Profile	Grouped settings under clear labels
Understand primary action	User can distinguish start/confirm action	Used consistent button placement and wording

Accessibility checklist

• High-contrast text on light backgrounds. • Labels accompany visual status cues. • Large, clearly separated tap targets. • Simple language and short labels. • Consistent focus/order so the interface is easier to scan. • Avoid relying on color alone to communicate completion or errors.

09 — Figma Deliverable Structure

The assignment requires a Figma file containing the complete high-fidelity mockups. The recommended file structure below can be recreated directly in Figma.

Figma page	Frames / content
01 — Cover	Project title, designer, version
02 — Research	Competitor notes + insights
03 — User Flow	Onboarding → Home → Plan → Activity → Progress → Profile
04 — Wireframes	Low-fidelity versions of key screens
05 — Design System	Colors, typography, spacing, buttons, cards
06 — High Fidelity	Onboarding, Home, Plan, Activity, Progress, Profile, Checkout
07 — Prototype	Clickable navigation between key frames

Figma file link: Add the student's actual Figma URL here before submission.

Suggested prototype connections: Onboarding → Home; Home → Plan; Plan → Activity; Activity → Progress; Home → Profile; Profile → Checkout/Plan.

10 — Reflection & Key Takeaways

Challenges faced

The main challenge was balancing the amount of wellness content with a simple beginner experience. A second challenge was maintaining visual consistency while giving different categories enough distinction. The solution was to establish a small design system first and then reuse the same card, spacing and navigation patterns across screens.

Improvements made

Early wireframes placed too much information on the Home screen. The refined version prioritizes progress and today's actions, while secondary content is moved into Plan and Profile. Navigation was also simplified so the user can always see the four main destinations.

Key takeaways

Good mobile UX is less about adding features and more about making the next decision obvious. A clear information hierarchy, consistent components, accessible contrast and iterative testing can make a feature-rich concept feel manageable.

Final submission checklist

✓	Case study PDF / slide deck
✓	Competitor research + insights
✓	User flow diagram
✓	Wireframes
✓	High-fidelity UI screens
✓	Design system + rationale
✓	Usability / accessibility considerations
✓	Reflection + improvements
→	Add actual Figma file link before submitting

This case study follows the assignment's requested structure: design process documentation, competitor research, user flow, wireframes, high-fidelity screens, design rationale, iterations, reflection and final presentation.
